Power Supply and Fuses

The system's power originates from the vehicle's battery, routed through the fuse box. Key fuses related to the door lock system include:

- Fusible link or fuse labeled "Door Lock" or similar, typically rated at 10-15A.
- Additional fuses in the fuse box that protect related circuits.

Proper fuse operation is critical; a blown fuse can disable the entire door lock system.

Door Lock Switches and Controls

Each door has a manual switch connected to the wiring harness. When pressed, these switches send a signal to the control module or relay. The diagram shows:

- Switch contacts connected to the relay coil control circuit.
- Wiring that runs from the switches to the central control modules.

Remote keyless entry (if equipped) connects to the control module via dedicated wiring, enabling remote locking and unlocking.

Relays and Control Modules

The central control module or relay assembly interprets signals from switches and remote controls to operate the door lock actuators. The typical diagram shows:

- Power supply line feeding the relay coil.
- Switch inputs connected to the relay coil circuit.
- Output lines from relays to the door lock actuators.

The relay acts as a switch, allowing high-current operation of the actuators controlled by low-current signals.

Door Lock Actuators

Located inside each door, the actuators receive electrical signals from relays. When activated, the motor inside the actuator moves the lock mechanism:

- Lock command: Sends current to the actuator to lock the door.
- Unlock command: Reverses current flow to unlock.

The wiring diagram shows the connection points, power supply, and ground for each actuator.

Common Troubleshooting Based on the Diagram

Identifying Wiring Problems

By referencing the diagram, one can check:
